Outline

Version Control

A screenshot of a file explorer window with a dark background. It displays a list of 15 files, each preceded by a small yellow icon with a black 'W'. The files are listed in a single column. The second file, 'Interesting-Project_Final version.tex', is highlighted with a grey background. The list includes backup files, final versions, and intermediate development files with version numbers.

Installation

After installation, open the terminal and input `git` to see if it is successfully installed. There should be something like this:

```
C:\Users\lanad>git
usage: git [--version] [--help] [-C <path>] [-c <name>=<value>]
       [--exec-path<path>] [--html-path] [--man-path] [--info-path]
       [-p | --paginate] [-P | --no-pager] [--no-replace-objects] [--bare]
       [--git-dir=<path>] [--work-tree=<path>] [--namespace=<name>]
       <command> [<args>]

These are common Git commands used in various situations:

start a working area (see also: git help tutorial)
clone      Clone a repository into a new directory

restore    Restore working tree files
rm         Remove files from the working tree and from the index
sparse-checkout Initialize and modify the sparse-checkout

examine the history and state (see also: git help revisions)
bisect     Use binary search to find the commit that introduced a bug
diff       Show changes between commits, commit and working tree, etc
grep       Print lines matching a pattern
log        Show commit logs
show       Show various types of objects
status     Show the working tree status

grow, mark and tweak your common history
branch     List, create, or delete branches
commit     Record changes to the repository
merge      Join two or more development histories together
rebase     Reapply commits on top of another base tip

collaborate (see also: git help workflows)
fetch      Download objects and refs from another repository
pull       Fetch from and integrate with another repository or a local branch
push       Update remote refs along with associated objects

'git help -a' and 'git help -g' list available subcommands and some
concept guides. See 'git help <command>' or 'git help <concept>'
to read about a specific subcommand or concept.
See 'git help git' for an overview of the system.
